STEVEN HILL
Serial No. 10/761,408
Filed: JANUARY 22, 2004

IN THE CLAIMS

1. to 18. (cancelled)

19. (original) An optical laser comprising REDGIVN material.

20. (original) An optical laser according to claim 19
comprising:

at least one waveguide comprising a REDGIVN channel;
at least one feedback element(s) defining a laser-
laser-resonator cavity in the waveguide so that laser light is
output from the waveguide when pumped;
a pump source.

21. (original) An optical laser according to claim 20 wherein
the pump source is a broadband optical pump source.

22. (original) An optical laser according to claim 20 wherein
the pump source is an electrical pump source.

23. (original) An optical laser according to claim 20
comprising a substrate and/or bottom cladding below the
waveguide and a top cladding.

24. (original) An optical laser according to claim 20 wherein
the laser cavity has a size, which is tuned to an excitation
wavelength of the rare earth dopant.

25. (original) An optical laser according to claim 20 wherein
the at least one feedback element(s) comprise a first highly

reflective mirror, and a second output coupler mirror which is partially reflective.

26. (original) An optical laser according to claim 20 wherein the at least one feedback element(s) comprise a first Bragg grating which is highly reflective, and a second Bragg grating which is which is partially reflective.

27. (original) An optical laser according to claim 20 wherein the feedback elements are frequency selective, and are tuned to be most reflective near a resonant frequency of the cavity.

28. (original) An optical laser according to claim 20 further comprising means for varying the wavelength(s) reflected by the feedback element(s) and varying the effective length of the resonator cavity to thereby tune the laser to a selected wavelength.

29. (original) An array of lasers according to claim 20 formed on a common substrate.

30. (original) The array of lasers according to claim 29 wherein each laser of the array of lasers has resonant characteristics and dopants selected to produce a respective different wavelength.

31. (original) The array of lasers according to claim 30 wherein each

laser has a respective laser cavity having a different length.

Filed: JANUARY 22, 2004

32. (original) A laser according to claim 20 further comprising a Diffraction Bragg reflector (DBR) grating formed into or close to the waveguide is used to tune the wavelength of light supported in the waveguide cavity.

33. (original) A laser according to claim 20 wherein the resonance characteristics of the waveguide cavities are individually selected by varying the pitch of the reflection gratings used to define the cavities which, along with the effective refractive index for the propagated optical mode, determines the wavelengths of light reflected by the gratings.

34. (original) A laser according to claim 20 comprising a surface-relief grating forming a distributed Bragg reflection grating fabricated on a surface of the wave guide.

35. (original) A laser according to claim 20 comprising:

- a conductive substrate having a first electrical contact;

- a transparent conductive cladding buffer;

- a layer comprising the wave guide,

- a second electrical contact on top of the REDGIVN channel;

- an electrical pump source.

36. (original) An optical laser according to claim 35 wherein the at least one feedback element(s) comprise a high

reflecting mirror and output coupler at opposite each end of the waveguide to form the resonating cavity.

37. (original) A laser component comprising:

a thin film containing REDGIVN and having a plurality of waveguides defined by channels within the substrate;

one or more feedback elements for providing optical feedback to the waveguides to form a respective laser-resonator cavity in each wave guide with a distinct resonance characteristic to provide lasing action at a selected wavelength when pumped, wherein injection of pump light at one or more suitable wavelengths into the laser-resonator cavity causes output of laser light at the selected wavelength in accordance with a longitudinal cavity mode of the cavity.

38. (original) A laser according to claim 37 further comprising:

a ferrule having a plurality of spaced-apart attachment sites; and

a plurality of optic fibers attached to the ferrule at a respective one of the plurality of spaced-apart attachment sites, each optical fiber also being connected to receive light from a respective one of the resonator cavities.

39. (original) A laser according to claim 37 wherein the laser-resonator cavities have a plurality of widths on a substrate surface to thereby define a plurality of effective indices of refraction for the cavities, the wavelength of a longitudinal cavity mode being dependent thereon.
